Maginhawa Ops: project handoff

Last updated 13 October 2026. This file is the single source of truth for picking the project up in a new Claude account or by a new person. Read it top to bottom before doing anything.

---

1. What this project is

An internal operations app for **Maginhawa**, a London restaurant group with **9 sites**. The first module replaces the finance team's current **end-of-day (EOD) report**, a web form that managers fill in after close. Later modules add opening and closing checklists, food-safety logs, repairs and maintenance, a staff handbook, and AI search over all the logs ("Ask your logs").

It started as a "Check65-like" product idea (Food Alert's Check65 app; the comparison is in `docs/reports/`). It narrowed to: **build our own apps on top of the group's existing Microsoft 365 setup, starting with EOD.**

Sites (9): Bintang, Guanabana, Belly, Ramo, Hoodwood, Bunso, Cafe Mamasons, Mamasons Kentish Town, Mamasons China Town.

Roles:

Role	What they do
Manager	Fills in the EOD for their site; sees their site's trends
Staff	Later: checklists and food-safety logs on the shared kitchen iPad
Admin	Head office: all-sites view, thresholds, targets, people
Accounting / Finance	Same head-office view as Admin, minus Settings; receives the reports

---

2. Where things stand today (the "as is")

The finance team's current EOD form is a **single static page on Netlify**. It posts JSON to a **Power Automate HTTP trigger**, which writes a row to **Excel / SharePoint** and sends emails. Daily targets are read from an Excel sheet by date.

Problems found in the live form (code read on 6–10 Oct 2026; nothing was submitted):

Security (urgent):

- The Power Automate trigger URL, including its signature, is visible in the page source. **It must be regenerated.**
- **Never copy that URL into any document, code or chat.**

Calculation bugs:

- "Net" is calculated as gross – service charge – tax, so **discounts are not subtracted**, even though the label says they are.

- The food and drink % are worked out from **net** but labelled **gross**.
- Delivery net is hard-coded as `gross / 1.2 × 0.55`.
- The wage thresholds (35% / 30%) are hard-coded.

Data handling:

- The lunch managers field is dropped and never saved.
- The top-level staff field mixes lunch kitchen/FOH staff with dinner managers.
- Discount and void lines are flattened into one text string.
- The cash warning only shows when *both* cash values are above 0.

Missing safeguards: no validation, no duplicate protection, no draft saving, and dates are stored as Excel serial numbers.

Reference lists in the form:

- **23 discount/comp reasons** (e.g. "Customer complaint · check", "Employee dining 20%").
- **15 void codes**, split into waste (W) and no-waste (NW).
- **Staff position lists** for kitchen, front of house (FOH) and managers.

---

3. Decisions already made (do not re-open without the user)

#	Decision	Notes
1	**UK market**, UK English, £, UK law	
2	**Devices: phone, tablet (iPad) and desktop**	Shared kitchen iPad plus managers' own phones and laptops
3	**Keep Power Automate and SharePoint** as the back end	No separate server or database for now. A Postgres/Supabase design was produced as the fallback (`docs/tech-plan/postgres-option/`)
4	**We code our own user-facing apps**	Not Power Apps
5	**Managers type the numbers in**	No till/EPOS integration in v1. The forecast works from the typed figures
6	**Web framework: React Router v7 in SPA mode (Vite, TypeScript)**, hosted on Netlify, installable as a PWA	Next.js was rejected because there is no server of our own. **Expo** (React Native) is only for a later native app, if one is needed
7	**Design direction:** Apple-like. **One dark "hero" card per screen**, then **Monzo/Revolut-style lists**, with **Things 3-style progress circles**	See §7. The user rejected other directions; don't drift back to them
8	**Sections can be filled in any order** from a hub ("Today's close"), not a strict wizard	Backed by research: same users every night
9	**Sign-in:** Microsoft 365 work account (Entra ID via MSAL) on phone and desktop; **shared iPad = photo grid of today's rota + 4-digit PIN**, plus a badge/QR alternative	A site device account sits underneath the shared-iPad login
10	**Forecasts:** same weekday over the last 6 weeks, nudged by bookings and the recent trend	Shown to managers (Trends) and to head office (Forecast tab). No AI needed

---

4. Technology

Layer	Choice
App	React + TypeScript, **React Router v7 (SPA mode, `ssr: false`)** on Vite. One codebase for phone, iPad and desktop
Libraries	react-hook-form + zod (forms and validation), TanStack Query (data), `@azure/msal-react` (sign-in), `vite-plugin-pwa` (offline and install), Vitest (tests)
Hosting	Netlify (static), with a catch-all redirect to `index.html`
Identity	Microsoft Entra ID through MSAL. Graph permission `Sites.Selected`, scoped to one SharePoint site
Data	**SharePoint site "Maginhawa Ops"**: 31 lists and 7 document libraries, accessed through the **Microsoft Graph API**. Use `$batch` (up to 20 requests per call) and honour `Retry-After`
Automation	**Power Automate flows F01–F12**, owned by a **service account**, standard connectors only. They handle submit emails, Teams messages, the Excel/Power BI feed, the 07:00 digest and late reminders
Reporting	Excel through Power Query now; Power BI later
Offline	Store on the device first, then an upload queue. Each record carries a `ClientId` UUID in a unique column, so a retry never creates a duplicate
Later	An Azure Function "AI proxy" calling the Claude API (default model `claude-opus-5-5`) for Ask your logs and the summaries

Monorepo layout (proposed):

```
apps/eod-web     React Router v7 SPA → Netlify   (start here)
apps/kiosk       Expo (later, only if needed)
packages/core    calculations, zod schemas, Graph data module (shared, unit-tested)
```

Scalability rules (full version in the tech plan):

1. No flow per checkpoint answer.
2. Index `Site`, `BusinessDate` and `Status`.
3. Archive yearly.
4. Batch and cache Graph calls.
5. Compress photos.
6. Service-account-owned flows.
7. Honour `Retry-After`.
8. Power BI on scheduled imports.
9. All data access in one module.

Limits to remember:

- 5,000-item list view threshold.
- 20 indexes per list.
- 12 lookups per query.
- About 30M items per list.
- Power Automate's daily action allowance is charged to the flow owner.

Volume estimate: about 1,250 items a day across 9 sites, about 460k a year, and about 9 GB of photos a year.

---

5. EOD calculation rules (the `core` package)

These fix the current bugs. Every rule should have a unit test.

Figure	Rule
Net sales (per service)	**Gross – service charge – VAT – discounts & comps**
Food % / Drink %	Food (or drink) sales ÷ **net** sales. Warn when food + drink ≠ net; the manager can confirm "It's right"
Covers	Booked + walk-ins
Net a head	Net ÷ covers (dine-in only)
Cash taken	Counted in drawer (by denomination) – float (**£150 default**, per site)
Cash difference	Cash taken – cash on till report. **Within ±£1 = balanced.** Outside that needs a **reason picked from a list** (refund paid in cash, paid out/petty cash, float not reset, miscount, other) plus an optional note
Delivery net	Gross × platform retention, a **setting per platform** (not hard-coded)
Day total net	Lunch net + dinner net + delivery net
Wage %	Wage cost ÷ day total net. **Green < 30%, amber 30–35%, red > 35%** (admin settings, per site)
Trading day	A report opened before **04:00** counts as the previous day
Discount lines	Lines must add up to the till's discounts & comps total; a gap gets a warning

Verified example (tested on real Postgres during planning):

Figure	Value
Lunch	gross £1,200, service charge £120, VAT £180, discounts £50 → **net £850.00** (40 covers)
Dinner	gross £2,400 → **net £1,700.00** (65 covers)
Deliveroo	gross £300 → **net £137.50**
Day total net	**£2,687.50**
Wages	£800 → **29.8%**

Validation philosophy:

- **Hard block only for real errors:** an unexplained cash difference, or a required section left empty.
- **Everything unusual is a warning** with "It's right" or "Fix".
- Submit stays disabled until required sections are done and the confirmation is ticked.

---

6. Screens (designed, on the canvas)

The interactive design canvas is a claude.ai artifact: **https://claude.ai/artifact/A7wNFaUeBKBo2eDJjtXiRa** ("EOD UI design").

> These artifact links are **private to the account that made them**. To use them from a new account, open each link in the original account and use **Share** first. A local copy of every screen is in `design/eod-canvas/`.

An earlier low-fidelity version is at https://claude.ai/artifact/KxTcCMxEYiNPcvhfrXUcDk ("EOD input wireframes", superseded).

Board	What it shows
Design language	Principles, colours, card and list samples
0 · Sign in	Phone/desktop: one card, "Sign in with work account" (Microsoft 365), link to the PIN option
1 · Today's close (hub)	Hero card with net so far vs the tonight forecast and section progress. A "Tomorrow" forecast card. Sections with Things-style circles (to do / in progress / done / skipped): Lunch, Dinner, Delivery, Promotions & other, Wages, **Tips & service charge**, Feedback, Handover. "What ran today" toggles; reporting identity
2 · Lunch	Hero = lunch net (live), vs forecast. From the till (inputs), covers, food & drink with a match check, cash (drawer count → float → till → difference + reason chips), discounts/comps as Monzo-style rows, on shift
Sheet · Count the cash	One row per note/coin: badge, typed count (phone number pad), value. Live total and "less float"
8 · Review	Hero = day net vs target plus 4 metrics. "Check before sending" (red blocks, amber warns). Breakdown rows (tap to edit). Confirm tick. Button reads **"Submit Monday · £2,687.50"**
Submitted	"Day closed", **"Received by head office 00:31"** (not just "sent"), "On time 26 of 28 this month", what happens next
Trends (manager)	Graph: last 2 weeks actual + 7-day dashed forecast with a likely-range band; switch Net / Covers / Wage %. Tomorrow card, rota wage warning, week-ahead list
iPad · Dinner, night mode	Sidebar with circles + two-column form
iPad · PIN sign-in	Photo grid of today's rota → 4-digit PIN → "Not you?"; "Scan your badge instead"
Desktop · Manager	Sidebar, hero, two-column form, right rail (day so far, still to do, ⌘↵ save)
Desktop · Admin, all sites today	Hero = group net (7 of 9 in), bars = 7 days actual + 7 forecast. Sites table (net, vs target, wages, cash, status). "Approve 4 clean closes" (with Undo). Needs attention with actions. Site detail panel
Desktop · Admin settings	Thresholds & checks: wage colours (live bar), cash tolerance, float, warn-only sales checks, trading-day end, late reminders. Menu: sites, people & roles, targets, discount reasons (23), void codes (15), delivery platforms, sections & questions

Board	What it shows
Desktop · Admin forecast	Group forecast next 7 days with graph (Net / Covers / Wage %), per-site sparkline + forecast + vs last week + watch note, "Watch this week", how it's worked out

All figures in the designs are **made-up examples**.

---

7. Design language (follow exactly)

What the user liked:

- Apple-like, minimal, sleek and premium.
- **One main dark card per screen**; everything else is **plain lists** like Monzo/Revolut (round icon, title, grey subtitle, amount on the right, hairline dividers).
- **Things 3 progress circles.**
- Intuitive and simple to follow.
- A thin custom scrollbar.

What the user rejected:

- An all-boxed iOS Settings look (grey background, every group in a white card).
- An "editorial, no boxes at all" version with bold rules.
- Tile grid plus custom keypad for the cash count.

Token	Light	Dark
Background	`#FFFFFF`	`#000000`
Text	`#1D1D1F`	`#F5F5F7`
Secondary text	`#6E6E73`	`#A1A1A6`
Fill (icons, inputs)	`#F2F2F5`	`#1C1C1E`
Hairline	`rgba(0,0,0,.08)`	`rgba(255,255,255,.10)`
Hero card	`#1D1D1F` , text `#F5F5F7` , secondary `rgba(245,245,247,.6)`	`#1C1C1E`
Primary button	Ink pill `#1D1D1F` / white text, 54px tall, fully rounded	Inverted
Links	`#0066CC`	`#2997FF`
Good / check / blocks	`#1F7A35` / `#B25000` / `#D70015`	`#30D158` / `#FF9F0A` / `#FF453A`

Type: system San Francisco (`-apple-system`), with **Geist** as the fallback; `tabular-nums` for all money.

- Hero figure 56–60px, weight 600, tracking –0.055em, **pence smaller and lighter**.
- Large title 34px bold.
- Section title 20px bold, sentence case.
- Body 17px; captions 13–14px grey.

Components:

- **Hero card:** radius 24–26px, soft shadow.
- **List rows:** 56–68px tall; 42px round icon; separators inset past the icon.
- **Inputs:** grey filled boxes with right-aligned numbers and a focus ring; accept "£1,200.00".
- **Status:** small tinted pills or tinted round icons, **always with words** ("£20.00 short", never just "–20").
- **iOS toggles** in green.

Rules:

- Colour only means status.
- One obvious next action per screen.
- Plain English (reading age about 9).
- Follow the device's light/dark setting.
- Touch targets at least 44px (bigger on the kitchen iPad).
- Undo instead of confirm, except the final Submit.

---

8. Research findings to build in (ranked)

Full detail with sources: `research/2026-10-research-findings.md`.

Before launch:

1. Reason codes and "None today" buttons.
2. Honest sync states (saved on device → sending → received by head office).
3. Tips & service charge section (Tips Act 2023: written policy, **3-year records**, worker statements).
4. Head office approve / send back, with resolution tracking.
5. 07:00 digest via Power Automate.
6. Handover categories (a maintenance note can raise a repair job).
7. iPad photo-grid PIN sign-in with a badge alternative (WCAG 2.2 3.3.8).
8. Undo toasts.
9. Specific Submit label.

Phase 2 differentiators:

1. Forecast and wage warnings (done in the designs).
2. Rule-based anomaly flags (e.g. "comps 3× usual by one person after 21:00").
3. Delivery payout reconciliation (nobody does this; DoorDash bought Deliveroo in Oct 2025).
4. True labour cost incl. employer NIC 15% above £5k and the NLW of £12.71 (April 2026).
5. Per-site thresholds with a "would have flagged" preview.
6. "On time X of Y this month" (not streaks).
7. HO one-tap "Thanks".

Later:

- AI: "Ask your logs" + summary of last night, with **every sentence linked to its source entry**.
- Employment Rights Act 2025 record-keeping (day-one SSP, 6-year holiday records).
- Right-to-work expiry tracker.
- Martyn's Law (sites holding 200–799 people; enforcement about 2027).
- Food-safety checklists with Bluetooth probes.
- Cmd+K for head office.
- Translations, with "Free items" as an alias for "comps".

Where we beat competitors (Tenzo, Nory, Restaurant365, Toast, 7shifts, Trail, Jolt, Check65 and others):

- Numbers and notes in one place.
- Cash counted by denomination.
- Late-night closes and offline use.
- Delivery reconciliation.
- Head-office review across all sites.
- AI that explains *why*, using the manager's own notes.
- A good fit for a 9-site group.

---

9. Plan and timeline

When	Phase	Done when
13–24 Oct 2026	**Set-up and sign-off**	Designs walked through with finance + 2–3 GMs. IT registers the app (admin consent), service account and site access. **Old Power Automate URL regenerated.** SharePoint lists provisioned from `docs/tech-plan/sharepoint/sharepoint-lists.json`. **Historic EOD rows imported from Excel** (forecasts need 6 weeks)
27 Oct – 5 Dec	**Build v1**	Sign-in, hub, all sections, cash count, review/submit, offline drafts, `core` calcs with tests; flows for the submit email and Excel feed; head office Today view and basic settings
8–19 Dec	**Pilot at 2 sites**	Run alongside the old form; compare nightly
22 Dec – 2 Jan	**Freeze**	No rollout during peak trading
Jan 2027	**Roll out to all 9**	Training per site; retire the Netlify form after 2 clean weeks; add tips, iPad PIN, approve/send back, 07:00 digest
Feb 2027	**Forecasts and insights**	Trends, Forecast tab, wage warnings, anomaly rules
Mar–Apr 2027	**Next modules**	Checklists, food-safety logs, repairs log
May 2027 →	**AI and extras**	Ask your logs, AI summary, handbook, delivery reconciliation; native app only if needed

Assumes 1–2 developers.

Main risks:

- IT admin consent (start now).
- The exposed Power Automate URL.
- The Christmas peak.
- SharePoint view limits (index and archive).

---

10. Open questions (need the client)

1. Which EPOS/till do the sites use? (v1 doesn't integrate, but VAT "digital links" under Making Tax Digital should be checked with the accountant if figures are re-keyed.)
2. Actual delivery contract terms per platform (commission/retention).
3. How long the EOD takes GMs today; interview the 9 GMs.
4. Each site's capacity (Martyn's Law tier).
5. Who owns tips/tronc, and is there an independent troncmaster?
6. Who builds it, and how many developers?
7. Food-safety module scope and probe hardware, when the time comes.

---

11. How the user likes to work

- Wants things **simple, intuitive and premium-looking**. Iterates visually; give options as quick previews when the direction is unclear.
- Prefers **concise answers** with clear tables, and deliverables as **PDFs or shareable pages**.
- Says plainly when they dislike something. Change only what they point at, and keep what they liked.
- The Gena data-model PDF they supplied was **only a style reference** (layout/format) from another project. Don't use its content.

---

12. What's in this folder

```

```

---

13. Suggested next steps for whoever picks this up

1. Read this file, then open the canvas link (or `design/eod-canvas/`).
2. Update `docs/tech-plan/Tech stack and architecture plan` so its web-console line says React Router v7 SPA instead of Next.js.
3. Scaffold the monorepo (`apps/eod-web` + `packages/core`), write the §5 calculations with Vitest tests using the verified example, then build the routes for each section.
4. Write the SharePoint provisioning script from `sharepoint-lists.json`.
